Authorization for this examiner's amendment was given in a telephone interview with David W. Victor on 11/24/2010, 12/01/2010, 12/03/2010.

The application has been amended as follows:

1. (Currently Amended) A method, comprising:
receiving a multicast packet to transmit to destination addresses;
writing a payload of the multicast packet to at least one packet entry in a packet memory;
generating headers for the destination addresses;
generating at least one descriptor addressing the at least one packet entry in the packet memory including the payload to transmit to the destination addresses; ~~[[and]]~~
generating a packet queue for each of the destination addresses; and
including, in each of the packet queues, generating, for each destination address,
at least one indicator, wherein each indicator in each of the packet queues addresses one descriptor, wherein the indicators in the packet queues for each the destination addresses address point to a same set of descriptors to associate the destination addresses with the same set of descriptors, wherein each descriptor identifies at least

one packet entry to be provided for the plurality of the destination addresses having indicators addressing the packet entries.

11. (Currently Amended) The method of claim 10, further comprising:
writing, to the local memory, information on [[one]] the output queue for the handle written to the local memory indicating the output queue to which the destination packet generated from the indicator addressed by the handle is queued.

13. (Currently Amended) A system, comprising:
a packet memory; and
circuitry in communication with the packet memory and enabled to:
receive a multicast packet to transmit to destination addresses;
write a payload of the multicast packet to at least one packet entry in the packet memory;
generate headers for the destination addresses;
generate at least one descriptor addressing the at least one packet entry in the packet memory including the payload to transmit to the destination addresses;
generate a packet queue for each of the destination addresses; and
including, in each of the packet queues, generate, for each destination address, at least one indicator, wherein each indicator in each of the packet queues addresses one descriptor, wherein the indicators in the packet queues

for ~~each~~ the destination addresses ~~address~~ point to a same set of descriptors to associate the destination addresses with the same set of descriptors, wherein each descriptor identifies at least one packet entry to be provided for the plurality of the destination addresses having indicators addressing the packet entries.

26. (Currently Amended) A system, comprising:

a switch fabric; and

a plurality of line cards coupled to the switch fabric, wherein each line card includes a network processor, wherein each network processor includes:

a packet memory; and

circuitry in communication with the packet memory and enabled to:

receive a multicast packet to transmit to destination addresses;

write a payload of the multicast packet to at least one packet entry in the packet memory;

generate headers for the destination addresses;

generate at least one descriptor addressing the at least one packet entry in the packet memory including the payload to transmit to the destination addresses; [[and]]

generating a packet queue for each of the destination addresses; and

including, in each of the packet queues, generate, for each destination address, at least one indicator, wherein each indicator in each of the packet queues addresses one descriptor, wherein the indicators in the packet queues

for ~~each~~ the destination address addresses point to a same set of descriptors to associate the destination addresses with the same set of descriptors, wherein each ~~indicators~~ indicator's descriptor identifies at least one packet entry to be provided for the plurality of the destination addresses having indicators addressing the packet entries.

29. (Currently Amended) An article of manufacture comprising hardware or a combination of hardware and software having code executed to transmit packets, communicate with a packet memory, and perform operations, the operations comprising:

receiving a multicast packet to transmit to destination addresses;

writing a payload of the multicast packet to at least one packet entry in a packet memory;

generating headers for the destination addresses;

generating at least one descriptor addressing the at least one packet entry in the packet memory including the payload to transmit to the destination addresses; ~~[[and]]~~

generating a packet queue for each of the destination addresses; and

including, in each of the packet queues, generating, ~~for each destination address,~~ at least one indicator, wherein each indicator in each of the packet queues addresses one descriptor, wherein the indicators in the packet queues for ~~each~~ the destination address addresses point to a same set of descriptors to associate the destination addresses with the same set of descriptors, wherein each descriptor identifies at least

one packet entry to be provided for the plurality of the destination addresses having indicators addressing the packet entries.
